· "Image Scan" is a component that allow you to scan pictures through TWAIN compliant technologies. "Image Scan" is a windowless control so it can be invisible at runtime. Now "Image Scan" supports all TWAIN compliant protocols including Windows Imaging Component (WIC) and Windows Media Photo Format (WMP). · With Windows Imaging Component (WIC) is possible to generate a TWAIN compliant stream and use it in network applications. With Windows Media Photo Format (WMP) the Windows Media Photo is the container that encapsulates images for the network. · "Image Scan" provides you the capability to select the source file. Acquire the image from the file, select the output image folder, and output image format. · By output image format you can select a format for saving or sending the scanned image. Currently the supported image formats include JPEG, BMP, GIF, TIF, PNG, WMF, EMF, and WBMP. · Finally you can use any of the supported image compression methods to reduce the image size. · To help you "Image Scan" provide a debugger which allows you to easily debug the user interface (UI) and the event handlers. · You can easily implement new image sources through the new API and support a wide range of image formats. And you can use a variety of compression and scaling algorithms. · In this release "Image Scan" support the following image formats: · JPEG · BMP · GIF · TIF · PNG · WMF · EMF · WBMP ·Please download the sample project from here: · I found a good direction to reference TWAIN and TWAIN Compatible reader here: After analyzing the source code sample project you could easily implement a TWAIN Compatible reader or printer in.Net. You also need to note about the CLSID value of your TWAIN Compatible reader or printer. That is the GUID for your item, which was registered with the manufacturer of the device. When the device sends data to the device driver, it is a GUID formatted message. (See Figure 1) Figure 1.
