Model railroa... In 2005, model train hobbyists built the world's first fully functional automated model railway, written in C and with line distance around 100 miles and the arrival of a remote control, set and electric train, the hobby saw a boom. What used to be a hobby and pastime has now become a full-fledged sport. And thanks to technology, it is one of the easiest hobbies to start, with an online community and a high degree of creativity from which to choose. This model railway software is ideal for the newbie who wants to build his or her own model railway layouts and start building a scene that will take their time and creativity to create! The open-source, niche market of model railways has developed rapidly since the creation of such a product by Richemont in 2005. And for the first time, we are creating a full-featured community-based software to create this type of train layout system, and also offer support and software updates. It is essential to ensure that you have a layout that matches your desired goals, and your own rules of play. We want to provide the best and most flexible solution that will let you create your own rules. Use Rocrail with a PC, Mac, Android, iOS or Raspberry Pi device. Your tracks can be set up on any platform to fit your needs. If your mode

Rocrail is an open-source application able to control a model train layout from one or more computers. It runs on Windows, Linux, Mac OS X, and Raspberry Pi, and uses the wxWidgets toolkits. The utility provides support for automatic and manual modes for controlling the trains via blocks, routes, schedules and complex patterns. Client-server architecture The program employs a server and client that work hand in hand via Internet protocols. It is not mandatory to run them both on the same computer. Rocrail can be used from a single PC connected directly to the layout, and you may control your layout from any computer on your home network or over the Internet. It also offers support for web-based interface which empowers you to run the layout from various web browsers. The server (Rocrail) works with a wide range of controllers, namely Märklin's 6051, the Uhlenbrock Intellibox, Loconet, SRCP connections such as DDL/DDW, and others. The client (Rocview) connects to the server over the network and can be used for planning the layouts. Controlling capabilities Rocrail offers you the freedom to configure the way the locomotives are controlled in detail. You may start with setting up locomotives, blocks, sensors, and routes, blocking events, and tweaking block occupancy. The application lets you create multiple workspaces that include all files needed by the Rocrail server to control a layout, work with a modular layout, make use of the R2Rnet network for making roaming trains travel from system to system, and enable various command stations. Furthermore, you can create staging blocks divided in multiple detection sections, tweak manual signals in automatic mode, define user actions to control anything, set up schedules for a realistic train flow, turn on the random automatic mode, define user actions to control anything, set up schedules for a realistic train flow, turn on the random automatic and very work with symbol themes in SVG. The Open Source project Rocrail is an open-source application designed to control model trains on your computers or the Internet. The tool provides support for auto and manual mode which allows you to control the train layout from multiple remote machines. The program operates under different protocols (Coast to Coast, Intellibox, Loconet and Märklin), and connects them to your computer or the Internet. You may use Rocrail to create and edit schedules, define routes and locomotive operating profiles. The interface is based on wxWidgets and uses a server-client architecture that allows you to control a layout from any place where a web browser runs. Rocrail allows you to tune manually the signals, block occupancy, pre-program and edit locomotive symbols, and tweak manual control parameters. In automatic mode the program can automatically control locomotives, traffic lights and power supplies. It lets you set up schedules to control your train layout sequentially or randomly. It also allows you to define user functions. For instance, the program may be able to control any robot arm, or may allow you to trigger the production line and the station.
